The problem and our approach

Vivian needs to know who is leaving, who will buy more, and which acquisition pays back, in NT$, with proof.

Our approach: read what customers already tell support (8,000 notes nobody reads), test every rule on past dates, and measure every campaign against a group held back on purpose.

- Cleaned 5 files, logged every fix
- AI read every note sentence once
- Rules tested on 1 Mar, 1 Apr, 1 May
- Past campaigns vs control group
- One command rebuilds it all

What the data shows

49%

of customers who tell support they may leave are gone in 60 days

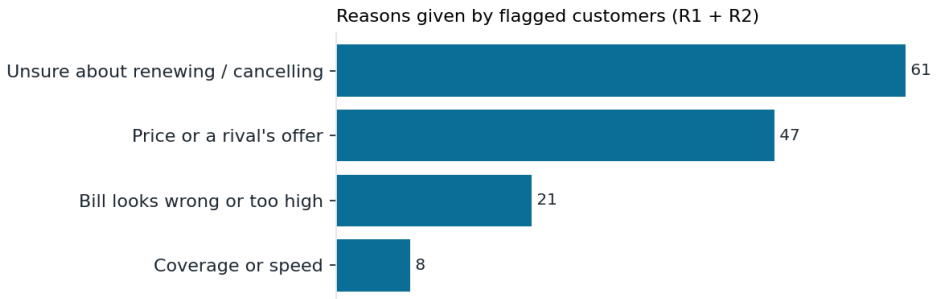

4.2%

for today's contract-end rule (average 3.7%)

0

extra sales from roaming blasts vs control

Who to target, and why

- **R1 leaving now**: porting, cancelling, signing elsewhere → call first
- **R2 wavering**: comparing, unsure on renewal → call or LINE/SMS
- **R3 new** (< 6 months, 2.6× churn) → welcome check-in
- **R4 unhappy** → fix the bill or the network
- **Earn more**: only customers who asked (15,340 at full scale)

The campaigns

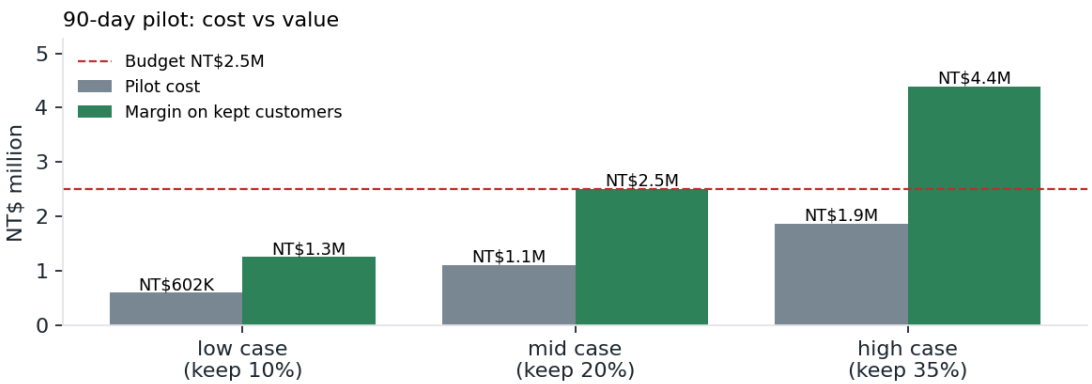

- Reason → approved offer: rival/price → Renewal discount or Data boost; device → Device credit
- Billing and network: fix it, no discount
- Stop roaming blasts (NT$2.0M/yr, no effect)
- Every message: legal footer + automatic compliance check
- 89 of 240 past campaigns would have failed

NT$3.7M–NT$13.1M
a year, retention

NT$2.2M–NT$2.6M
a year, earn more

NT$1.4M–NT$4.2M
a year, acquisition shift

The 90-day pilot

NT$1.1M

expected cost, max NT$1.9M

1.3%

of would-be leavers kept = break-even

20%

held back at random; stop at day 45 if not on track

Our recommendation

> Approve the 90-day retention pilot: NT$1.1M expected, inside NT$2.5M, for postpaid customers who tell support they may leave.

- Week 1: connect the weekly notes file; first call list to the call centre
- Day 45: check contacted vs held-back churn against the break-even
- Day 90: decide to scale retention to the full base, and redirect roaming and broad upsell spend
